Drosophila melanog D. melanogaster 1g Mouse beta-catenin Human ORFX protein Mouse beta-catenin Human polypeptide

Human legless homo Human BCL9 homolog Human polypeptide

Description

WPI; 2001-457740/49.

N-PSDB; ABA09052.

```
homologous amino acid domains with the legiess (1g9) protein, a downstream component of the Wnt/Wingless (Wnt/Wg) signaling pathway involved in the formation and mainteannee of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cytostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Wnt pathway, where the cancercous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the human legiess (1gs) protein homologue lgs/bc19 described in the disclosure of the invention.
                                                                                    Novel polypeptide useful in therapeutic method for treating disorders of cell fate such as cell differentiation or cell proliferation
                                                                                                                                                                                                     This invention describes a novel polypeptide sharing one or more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100.0%; Score 136; DB 23; Length 1426; 100.0%; Pred. No. 2.9e-12;

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides of polypeptides in a sample, and methods of detecting the nucleotides of polypeptides of the invention. Although novel, many of the bind to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth activity; hasematopolesis regulatory activity; tissue growth activity; hasematopolesis regulatory activity; tissue growth activity; communication or chemokinetic activities; panding activities; or may be conducted or theorem activities; or no may activity in the conduction or metastasis.

Computed in oncogenesis, cancer cell proliferation or metastasis.

Conductions activities; receptor or ligand activities; or may be conducted or their properties and nucleotides of conductions (e.g., myeloid or lymphoid cell conduction activities), protein or gene therapy. Such conditions include ancest, hasematopoletic disorders (e.g., myeloid or lymphoid cell activities), arterial ischaemia, bone disorders (e.g., myeloid or lymphoid cell activities and activiti Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neurophthelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screaning techniques. The present sequence represents a novel human Gaps Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject ö Length 1435; Indels 100.0%; Score 136; DB 22; 100.0%; Pred. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidates, therapeuticia and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL/16-78-ABL/30511), expressed DNA sequences (ABL/16-78-ABL/30511), attended DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA01910) that exhibit activity elating to grychaine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy, The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                          This invention describes a novel polypeptide sharing one or more homologous amino acid domains with the legless (1gs) protein, a downstream component of the Whi/Wingless (Wmr/Wg) signaling pathway involved in the formation and maintenance of spatial arrangements and proliferation of tissues during development, and in the formation and growth of many human tumours. The products of the invention have cycostatic activity and can be used to treat cellular disorders, blood disorders and cancers caused by over-stimulation of the Whr pathway, where the cancerous condition is colon, breast, head and neck, brain, thyroid, medulloblastoma or skin cancer. The product could also be used to promote tissue regeneration and repair. This sequence represents the prosophila melanogaster (funitfly) legless (1gs) protein described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New beta-catenin nuclear localised protein for diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g.
Novel polypeptide useful in therapeutic method for treating disorders of cell fate such as cell differentiation or cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence emouse beta-catenin nuclear localised protein.

Claim 1; Page 81-88; 113pp; Japanese.

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1) the specification). ABM15762 to ABM27252 encode the human ORFX proteins given in ABM15762 to ABM27252 encode the human ORFX proteins given in ABM00010 to ABM1500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in sene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, hamorrhage, osteoarthritis, neurodegenerative disorders, disorders, hamorrhage, osteoarthritis, neurodegenerative disorders disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic allowed disorders disorders, and allowed disorders of the organ property of the organ contraction disorders and disorders of the organ property of the organ contraction disparate and disorders and disorders of the organ contraction disparate and disorders and disparate and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a beta-catenin nuclear localised protein and DNA encoding the protein. The protein and encoding DNA are applicable in diagnosis and treatment of diseases associated with nuclear localisation of beta-catenin e.g. cancer, including gene therapy. The present sequence represents the amino acid sequence mouse beta-catenin nuclear localised protein #2.
                                                                                                                                                                          ö

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or polynucleotides and polypeptides have various cytokine. Jike activities, e.g. stem cell growth factor activity, haematopoissis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                        Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptiddt therapy, stem cell growth factor, haematopoiesis; tissue growth factor, immunomodulatory, cancer, leukaemia, nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabletic; antiallergic; hepatotropic; antidiabletic; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.
                                                                                                                                                                                                                                (ABB57137-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel 1405 isolated polypeptides, useful for diagnosis, treatment and prevention of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative
                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are
                                                                                                                                                                                                                                                                                                                                                                                  ö

isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune colitis; (c) cardiovascular thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular discates such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infectious diseases such as viral, bacterial, fungal note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers. oligomers. and for chromosome and gene mapping, and in recombinant production of [II]. The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed senes. (I) is useful in gene interapy rechniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful in detecting or

CC quantitating a polypeptide in tissue, as molecular weight markers and as cc a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity.

CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations of angnostic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences of the invention.

CC and to produce other types of data and products dependent on DNA and CC and to produce other types of the invention.

CC and to produce other types of data and products dependent on DNA and CC and to produce data for this patent did not appear in the printed capanostic amino acid sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed capacitization, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.

2: pir2:\*
3: pir3:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
